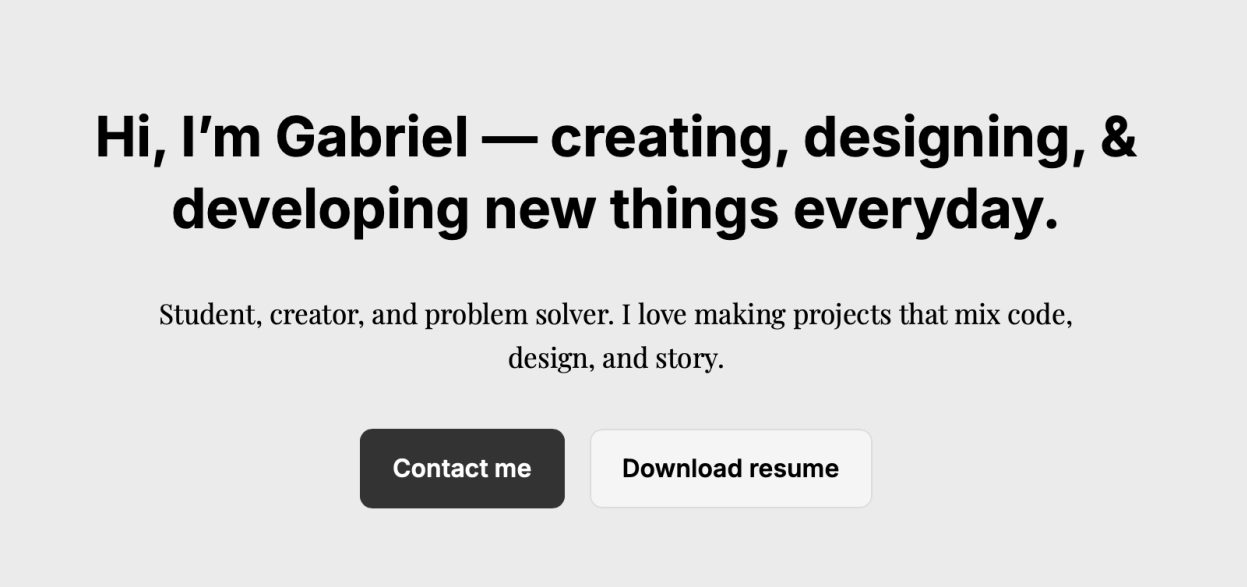
Review and Bibliography:

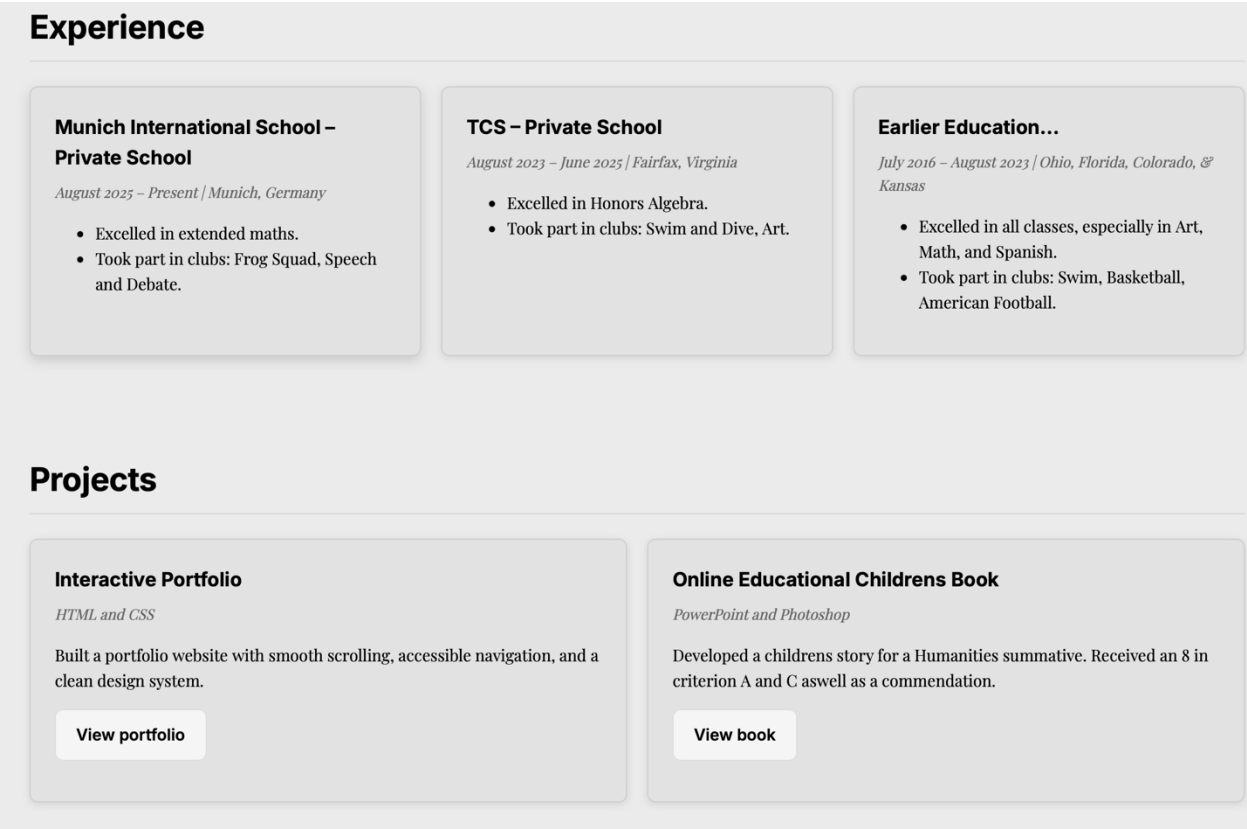
Code Review

For this section, I used CSS and html. CSS was used to create the skip links and design, while html was used to create the actual words. I specifically used CSS for the skip links in this section in order for it to be easier for a viewer to use the website and find what they are looking for.



In this section, I made sure to add a contact button and a resume section. This Is because it is likely the most important thing a person is looking for

when they are on your digital portfolio.



For both the experience and project section I used html cards to make it look cleaner and more modern. I also added a stylized effect that would highlight the card when the mouse is hovered over it. Furthermore, I also added a feature where you could view the project, allowing me to have actual proof of me doing said project.

I also implemented the html cards in my skills section. However in this section I found it irrelevant and that it would be unnecessary as people wouldn’t be hovering over each and every skill.

Contact

Want to work together? Send an email to gabriel_lemberg@mis-munich.de

My contact section is at the very end. I did this so that a person would have to view everything about me before actually contacting me. I also added an href link over my email which, when clicked, would send the viewer to outlook or their email platform to email me.

```
  <script>
    window.addEventListener('scroll', () => {
      const sections = document.querySelectorAll('section[id]');
      const navLinks = document.querySelectorAll('nav a');
      let current = '';
      sections.forEach(s => {
        if(s.offsetTop - 100 <= scrollY) current = s.getAttribute('id');
      });
      navLinks.forEach(l => l.classList.toggle('active', l.getAttribute('href') === '#' + current));
    });
  </script>
</head>
```

I also implemented Java script in my website. Java was used to add a slight highlight to each section of my website when scrolling. This was mainly done just so that I could use Java in my website. But it also makes it more easy and enjoyable for the user to view my website.

Bibliography

I didn’t use any website other than github for code. Most of my coding was done inside of a codespace, however.
